Emerging Aspects of Lab Safety

The 2011 report **"Experimenting with Danger**" from U.S. Chemical Safety Board, which discussed 3 research lab events was a cultural watershed for academic labs.

National Responses to the CSB

The CSB report led to follow up from:

- The ACS Advancing Graduate Education report
- National Academy of Sciences Safe Science Report
- APLU Safety Culture toolbox

2013

2014

2016

Key APLU Report Recommendations

- Develop a risk assessment process for laboratory safety that is integral to all activities conducted in the laboratory or the field.
- Embed **safety communication** in laboratories, classes, departments and throughout the wider campus.
- Institutions should provide laboratory safety education and training for students, faculty, EH&S staff, and department heads.

The New Public Expectation

NFPA 45 Chapter 12, 2015

Instructor Responsibilities

- 1. Documented hazard risk assessment
- 2. Safety briefing for students prior to the start of each experiment to review the hazards of the chemicals used, the PPE required for the experiment, and review emergency procedures.
- The Big Deal: These requirements are protocol specific, not a generic set of rules for lab classes

Lab Safety requires a System, not a Solution

Managing lab hazards involves organizing **5 strategies** into a **resilient system**:

- 1. Hazard Analysis and Reduction
- 2. Engineering Controls
- 3. Training and Oversight which support Situational Awareness
- 4. Personal Protective Equipment
- 5. Emergency Planning and Response

Safety Culture is the element that holds the system together as situations change

The RAMP approach to Building a Lab Safety System

Developing a Chemical Safety system involves addressing six elements:

- 1. EHS Culture
- 2. Hazard Identification
- 3. Risk Assessment
- 4. Managing Safety
- 5. Planning for Emergencies
- 6. Protecting the Environment

From Stuart and McEwen. 2016

CO2 RAMP and Bowtie

Assessing general ventilation effectiveness in the laboratory

The goal of a laboratory's general ventilation system is to control airborne contaminents below concentra-tions of concern while maintaining a condicatable environment. One concern while managing general baboratory ventilation is how uniform by the room is ventilated. We have observed that, depending on the configuration of the ventilation supply and exhaust points relative to the geometry of the room, there may be rares of a laboratory that are less well-wentlated than others. This factor must be assessed when manipung minimum general ventilation rates for that lab. In order to determine how effective general ventilation systems are in exciting laboratority endowings in the room of the raising the CO₂ (yet) across the room above 10,200 parts per million. This apper describes the reasons for this work, the method we use, and reports our observations about this approach to assessing laboratory ventilation effectiveness.

Assessment

ayram،

Risk Assessment is a Chem Informatics Challenge as well as an EHS challenge

- Currently, it's Caveat emptor: Chemistry textbooks and laboratory manuals provide a set of generic rules, followed by "see the MSDS".
- For example, Wikipedia provides links to random MSDS sources; Linkrot is a serious problem some sources are kaput, many are dated.

Material Safety Data Sheet [edit]

The handling of this chemical may incur notable safety precautions. It is highly recommended that you seek the Material Safety Datasheet (MSDS) for this chemical from a reliable source and follow its directions.

Di-tert-butylphosphinoferrocene . An oven-dried 1000-mL four-necked (one 34/45 joint and three 24/40 joints) roundbottomed flask is allowed to cool in a desiccator over anhydrous balcium sulfate . Once cool , the central joint is equipped with an overhead mechanical stirrer , the glass rod of which is fitted with 7.2 x 2 cm Terlon paddle , coated with lubricant (Note 1) and sheathed by a 34/45 jointed glass stirrer bearing . The remaining three necks are fitted with a thermocouple in a 24/40 adapter , an argon line connected to a 24/40 adapter , and rubber septum . The rubber septum is removed from the fourth neck and the flask is charged with ferrocene (8.0 g , 43.0 mmo) , 1 equiv) (Note 2) . A 250-mL pressureequalizing addition funnel with a 24/40 joint is fitted in the fourth neck and the reaction set-up is flushed with argon for 5 min (see Note 3 for an image of the reaction setup) .

Lab Safety Resources

The Vision Beyond 2015

- The emerging web favors:
 - Sites designed as a nodes in the network rather than Sources of Truth
 - Contextual Usability (use of the information beyond the screen)
 - Open source peer curation, building on the examples of e-mail lists and Wikipedia
- What is emerging is a flexibly structured ecosystem of data, workflow tools and domain expertise mapped to the essential commonalities of the use case and content, connected by good information management practices

Wikipedia articles

Information Practices that Support this Vision

- Ontology: the machine readable system of *definitions* and *links* between those definitions
- Annotation: the human process (perhaps machineassisted) of prioritizing data elements and making decisions based on the available information and goal of the project
